# Guide to sources of information

This is intended to help users of the Literature Search Protocols decide which information resources to search, in addition to providing information about access to these resources and assisting in the compilation of the search documentation. All information given below is believed to be correct at the time of publication; however Thames Valley & Wessex Librarians do not take responsibility for the accuracy of the information and recommends that individuals take steps to verify the information given. In particular, the section on technical specification aims to highlight any known issues with certain versions of web browsers. It was not possible to test every resource so this section is for guidance only and its accuracy cannot be guaranteed.

To quickly identify whether you'll be able to access the resources listed, please look out for the labels listed below.

## Appendix 4 Search Discovery Tools

### Go Pubmed <http://www.gopubmed.org/web/gopubmed/>

GoPubMed® allows users to find information significantly faster and guarantees completeness of search results. The fundamental difference between GoPubMed's semantic search technology and traditional search engines such as PubMed or Google is the use of background knowledge. Semantic algorithms connect text – abstracts from the MEDLINE database – to background knowledge in the form of semantic networks of concept categories, also called ontologies or knowledge base. This is done by **meaning** and **not** by **keywords** only. So results are meaningfully structured and intelligent semantic navigation becomes possible. You can also view publication statistics based on your search terms including top years published, countries, cities, authors, journals, subject terms

### Knalij <http://knalij.com/>

Presents Pubmed results visually using interactive maps. The maps show connections between medical concepts and the extent of the research for each of those concepts

### MeSH on Demand - <https://www.nlm.nih.gov/mesh/MeSHonDemand.html>

Paste in a block of text and generate a list of relevant MeSH terms

### Pubmed PubReMiner - <http://hgserver2.amc.nl/cgi-bin/miner/miner2.cgi>

Provides detailed analysis of Pubmed Search results. Generates frequency tables to show which journals you topic is published in the most, which authors are most active, which words appear most in the titles and abstracts, which MeSH terms appear most frequently

### Quetzal – Linguistic searching of Medline <https://www.quetzal-search.info/>

Uses ontology based searching of Medline to deliver contextually relevant results. Quetzal's *Power Term*™ functionality allows users to find all members of a category such as “diseases” without cluttering results with hits from general terms (e.g., disease, syndrome), resulting in lists that specifically answer questions such as: “Which diseases are affected by caffeine?” Basic version available for free. Subscription required for advanced features

**SJR SCImago Journal & Country Rank** <http://www.scimagojr.com/index.php> A portal that includes the journals and country scientific indicators developed from the information contained in the [Scopus](#)® database. It includes the Shape of Science which visually illustrates the bibliometric data
